

In-Class Lab #7: Acceptance Testing for a Real-World Application

Overview

Write acceptance test criteria for a software application you regularly use.

Background

Two types of acceptance criteria:

1. Scenario-Based (Given-When-Then)

Describes user workflows:

- **Given** = Starting state
- **When** = User action
- **Then** = Observable outcome (what user sees/experiences)

Example: *Given a user has items in their cart, when they apply a valid discount code, then the total price decreases by the discount amount and "Discount Applied" displays in green.*

2. Rule-Based

Clear pass/fail requirements:

- **Functional:** "Tax must be calculated at 13% for Ontario addresses"
- **Non-Functional:** "Page must load in under 3 seconds" (performance, security, usability)

Task

Choose an app you actually use (social media, shopping, banking, transportation, etc.)

Create minimum 10 acceptance criteria:

- At least 6 scenario-based (Given-When-Then)
- At least 4 rule-based (including at least 1 non-functional)

Think about: What would you test after a new deployment to ensure critical features work?

Submission Format

Application Info

- App Name:
- Why you use it: (1 sentence)

Scenario-Based Acceptance Criteria

ID	Acceptance Criterion (Given-When-Then)
SAC-01	Given [state], when [action], then [observable outcome]
SAC-02	...

Rule-Based Acceptance Criteria

ID	Type	Requirement
RAC-01	Functional	[Specific measurable requirement]
RAC-02	Non-Functional	[Performance/security/usability requirement]

Example: Uber Eats

Why I use it: I order dinner 2-3 times per week

Scenario-Based:

ID	Criterion
SAC-01	Given a user is browsing restaurants, when they add an item to cart, then the cart icon updates with item count and subtotal appears at bottom
SAC-02	Given an order is placed, when driver picks up food, then user receives push notification "Your order is on the way" with ETA

Rule-Based:

ID	Type	Requirement
RAC-01	Functional	Delivery fee must be waived for orders over \$15 with Uber One membership
RAC-02	Non-Functional	Search results must load within 2 seconds on 4G
RAC-03	Non-Functional	Credit card numbers must show only last 4 digits

Marking Scheme - 5% (20 points)

Criteria	Marks
Scenario-based criteria (6+): proper format, observable outcomes, specific	9
Rule-based criteria (4+): clear pass/fail, includes 1+ non-functional	6
Quality: based on real experience, demonstrates critical workflows	5
Total	20

Key point: Base criteria on YOUR actual use of the app. AI generated responses are very easy to catch if you don't have a specific use case so be careful. Be specific with values, times, and observable outcomes.
